

SEO Audit: Significant Progress, But Critical Gaps Remain

What's Improved

The page is now being server-rendered or pre-rendered — when I fetch the URL, I'm getting actual HTML content with headings, copy, and links visible, not an empty JavaScript shell. That was the biggest pre-launch risk and it appears to be resolved. Google can now read the page.

Meta titles and descriptions are in place on the homepage. Open Graph and Twitter card tags are populated. Canonical URLs are set. These are foundational and they're done.

What's Still Broken

1. CRITICAL: URLs contain literal spaces

Your category URLs look like this: `/category/dementia friendly`, `/category/kids coloring books`, `/category/pets`. URLs cannot contain raw spaces — they get encoded as `%20`, which you can see in the canonical: `/category/dementia%20friendly`. This is broken in several ways:

- Bad for SEO (Google heavily prefers hyphenated, clean URLs)
- Bad for sharing (links look ugly and untrustworthy: `dementia%20friendly`)
- Bad for analytics (harder to read in reports)
- A signal of low technical quality to crawlers

These need to become `/category/dementia-friendly`, `/category/kids-coloring-books`, `/category/pets`, `/category/anime-portraits`. And per my earlier recommendation, ideally `/memory-care-coloring-books`, `/personalized-coloring-books-kids`, etc.

2. CRITICAL: Collection pages are nearly empty

The Dementia-Friendly collection page has essentially no on-page content. It shows:

- An H1: *"Dementia Friendly Coloring Books for Mom and Dad"*
- A hero image
- A "Start creating NOW!" button
- ...and then the footer.

There's no body copy, no explanation of the collection, no sample pages, no testimonials, no FAQ. Google has nothing to rank. This page will not compete for *any* meaningful search term, no matter how good the title tag is.

The meta description on this page is also generic boilerplate: *"Explore our unique coloring book collection..."* — it doesn't mention dementia, Alzheimer's, memory care, or any term someone would actually search.

3. Title tag inconsistency on collection pages

Every collection page appears to share the same title: *"Custom Coloring Book Collection | sktchLABS"*. That means Google sees four pages with identical titles, which it treats as a duplicate-content signal and a sign of low effort. Each collection needs a unique, keyword-rich title:

- *"Personalized Coloring Books for Dementia & Alzheimer's | sktchLABS"*
- *"Personalized Kids Coloring Books from Your Photos | sktchLABS"*
- *"Personalized Pet Coloring Books & Memorial Sketches | sktchLABS"*
- *"Anime Portrait Coloring Books from Your Photos | sktchLABS"*

5. Twitter card metadata is wrong on subpages

On the Dementia-Friendly page, the Twitter card title still says *"Custom Coloring Books from Your Photos | sktchLABS"*— the homepage title. When someone shares that page on social media, it'll show the wrong title and description. Each page's social metadata should reflect that page.

6. FAQ content is incomplete

The homepage shows FAQ headings (*"How long does it take to create a book?"* and *"What kind of photos work best?"*) but the answers don't appear in the rendered HTML. Either the answers aren't there yet, or they're hidden in accordion components that aren't server-rendered. If Google can't see the answers, you lose the FAQ schema opportunity entirely.

7. No visible sitemap reference

I can't verify your sitemap.xml or robots.txt from here, but you should confirm with your developers that both exist, that robots.txt references the sitemap, and that the sitemap has been submitted to Google Search Console. This is the standard mechanism by which Google discovers and crawls all your pages efficiently.

8. Step 5 is missing

The homepage says *"Create your personalized coloring book in 5 simple, creative steps"* but there are only 4 steps in total.

Summary

Your developers fixed the *infrastructure* problem (rendering) but haven't yet fixed the *content* problem. Search engines can now read your site — but there's not much there worth indexing yet. The Dementia-Friendly page in particular is the page that should be doing the heaviest SEO work, and right now it's a placeholder with a button.

The good news: none of the remaining issues require a re-architecture. They're all content, copy, and metadata fixes that can be done quickly.

Want me to draft the actual copy and metadata for the four collection pages? That would knock out items 3, 4, and parts of 5 in one pass.
